Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/526,503

Applicant(s)

SUZUKI ET AL.

Examiner

SAIRA HAIDER

Art Unit

1796

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 10 February 2009.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-4, 7, 11-16 and 19-22 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-4, 7, 11-16 and 19-22 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SF/08)
Paper No(s)/Mail Date 03/16/2009
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
2. Claims 1-4, 7, 11-16, and 19-22 are rejected under 35 U.S.C. 103(a) as being obvious over Suzuki et al. (WO/01/83594) in view of Lenk et al. (US 5,948,441).
3. The citations for the Suzuki reference are derived from the English Language Equivalent: US 2003/0094715 A1.
4. Suzuki discloses a method for the preparation of microspheres from an emulsion, comprising the following circulation steps: formation of an emulsion, filling the emulsion in a vessel (microsphere storage tank), filtering the emulsion, evaporating the organic phase, and collecting microspheres [0122-0126; 0153].
5. The emulsion has an organic phase containing an organic solvent having a boiling point lower than that of water, a hardly-water-soluble biodegradable polymer, and a medicament, the organic phase is emulsified in an aqueous phase [0039, 0046]. The emulsification takes place in an emulsifying apparatus via a homogenizer [0052, 0159].
6. A portion of the aqueous phase of the emulsion is carried out by passing the emulsion through a filter (e.g. a stainless mesh filter, a glass filter, a ceramic filter) [0118]. The filtered emulsion is circulated to a hollow fiber membrane which evaporates the organic solvent [0113-0118].
7. Suzuki discloses dissolving or dispersing the medicament in a solution of the polymer and the organic solvent [0039-0043]. Suitable organic solvents include halogenated aliphatic hydrocarbon solvents [0044]. In the emulsifying step, the homogenizer operates at a speed of 2,500 rpm and is thus considered high-speed [0159]. It is noted that transfer of the emulsion from the emulsifying

apparatus to the vessel is disclosed as being a batch process step [0139], wherein Suzuki exemplifies a vessel which is about 226 times larger than the emulsifying vessel [0159-0161]. The aqueous phase is present in an amount of 1 to 10,000 parts by volume per 1 part by volume of the organic phase [0055]. Suitable polymers include the polyester of a hydroxyfatty acid [0047]. The microspheres are collected via centrifugation [0142]. The microspheres can be dispersed in an excipient and solidified by lyophilization [0148].

8. Suzuki fails to disclose the (1) utilization of a cross-flow filter wherein the filtrate is recycled into the emulsifying apparatus, and (2) evaporation of the organic solvent inside the vessel.

9. In reference to the first deficiency of Suzuki, attention is directed towards the Lenk et al. reference. Lenk discloses a method for the size separation of particles via tangential flow filtration (or cross flow filtration). Lenk discloses that cross flow filtration is better than traditional filtration process (such as ceramic filtration) because it prevents filter cake build-up in the filter surface, eliminates dead-end extrusion of larger particles, and allows for the maintenance of the flow rate of the liquid as it is passed over the membrane (abstract; col. 1, lines 24-46). Lenk discloses that cross flow filtration is useful in the separation and classification of emulsions according to size (col. 7, lines 31-34). Additionally, Lenk recognizes that cross flow filtration can be done aseptically, and that the process can be used to remove untrapped bioactive agent (col. 7, lines 35-38; col. 8, lines 14-15). It would have been obvious to one of ordinary skill in the art at the time of the invention to utilize the cross flow filter of Lenk in place of the ceramic filter in the invention of Suzuki in order to size the emulsion (and thus size the resulting microspheres), in order to prevent filter cake build-up, eliminate dead-end extrusion of larger particles, and remove the untrapped bioactive agent (medicament). Specifically, it is noted that it would have been obvious to recycle the untrapped bioactive agent and utilize it in the formation of the emulsion. The motivation to recycle the

unentrapped bioactive agent in the aqueous phase is to prevent adherence of the medicament to the outside of the formed microspheres. Wherein it is undesirable to have the medicament adhered to the outside of the microspheres as recognized by Suzuki [0144].

10. Suzuki in combination with Lenk fails to disclose evaporation of the organic solvent inside the vessel, it is noted that Suzuki discloses this limitation, but it is not in combination with the filtration. However, it would have been obvious to one of ordinary skill in the art at the time of the invention to evaporate the organic solvent inside the vessel in the process taught by the combination of Suzuki and Lenk. The motivation is to minimize the risk of clogging of the hollow fibers since the emulsion is not passing through the hollow fibers, as in the circulation method, rather the emulsion is contacting the outside of the hollow fibers [0014, 0121, 0129]. Thus, instead of circulating the emulsion through the hollow fibers in order to remove the organic solvent, the immersion method is utilized.

11. In reference to claim 3, Suzuki discloses transfer of the emulsion into the vessel as a batch step, wherein, it has been held that continuous operation is obvious in view of the batch process of the prior art. *In re Dilnot*, 319 F.2d 188, 138 USPQ 248 (CCPA 1963). Thus, it would have been obvious to continuously transfer the emulsion into the vessel in the process taught by the combination of Suzuki and Lenk.

12. In reference to claims 11 and 13, the Lenk reference discloses that as the filtrate is collected from the cross flow filter it is desirable to add in a solution at the same rate as which the filtrate is removed in order to maintain the volume. Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to maintain a constant volume in the vessel of Suzuki (in the process taught by the combination of Suzuki and Lenk) via the addition of the emulsion at the same rate the filtrate is removed, wherein optimization of the rates is within the skill of one in the art.

13. In reference to claims 13 and 14, Lenk discloses that the filter size of the cross flow filter is chosen depending on the size of the particles to be removed (col. 7, lines 29-30), Lenk further shows that the size of the particles filtered depends on the size of the particles input into the filter (col. 8, lines 35-44). Thus the filter size is recognized as a result effective variable. It would have been obvious to one of ordinary skill in the art at the time the invention was made to utilize a filter with a pore size in the range of 0.01 to 10 μm (in the process taught by the combination of Suzuki and Lenk), since it has been held that discovering an optimum value as a result effective variable involves only routine skill in the art.

14. In reference to claim 21, the combination of Suzuki and Lenk fail to disclose that the medicament is recovered from the aqueous solution after collection of the microcapsules. It would have been obvious to one of ordinary skill in the art at the time of the invention to extract any medicament contained in the aqueous phase (in the process taught by the combination of Suzuki and Lenk) in order to salvage expensive drugs.

Response to Arguments

15. Applicant's arguments filed 02/10/2009 have been fully considered but they are not persuasive.

16. Applicant has essentially argued that the claims specify that the filtrate is recycled to the emulsification step, not the microspheres vessel as in Suzuki. In response, it is noted that in the obviousness rejection the examiner noted that it would have been obvious to recycle the filtrate to the emulsification step instead of the tank (microsphere vessel). The motivation was to utilize the untrapped bioactive agent in the formation of the emulsion, wherein Suzuki explicitly notes that in order to encapsulate the bioactive agent it must be present in the emulsion [0039, 0046].

Therefore there is both motivation and a reasonable expectation of success of recycling the filtrate to the emulsification step not the tank in the process of Suzuki.

17. In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., low amount of aqueous solution required and ability to downsize) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Gemst*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

18. Applicants have provided calculations regarding the cycle times, aqueous solution requirement, and the amount of microspheres formed in the herein invention and the prior art. It is not clear where applicant obtained the yield of 100% calculation for the prior art (see Remarks page 4, ¶ 2). Additionally, the examiner was unable to locate support for the inventive calculations and applicant's have failed to provide any citations.

19. In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, applicant has argued the absence of any suggestion to include the hollow fiber membrane in the tank. In response, it is noted that Suzuki explicitly exemplifies the hollow fiber membrane immersed in the emulsion contained in the tank (Figure 2, 4, and 5). Wherein Suzuki states that the size of the hollow fibers is selected such that clogging is minimized and surface area is increased to allow for greater contact [0121, 0127-0134]. Further the Suzuki reference notes that the immersion type (the hollow

fiber membrane located inside the tank) is one of the various well know organic solvent evaporation methods [0112].

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SAIRA HAIDER whose telephone number is (571)272-3553. The examiner can normally be reached on Monday-Friday from 10am-6pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, James Seidleck can be reached on (571) 272-1078. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
